1. We have talked about the Waterfall, Rapid prototyping and Spiral process models. Comparing and contrasting these three process models, under what conditions would each be best for embedded systems development? Explain your rationale and also include a consideration of “risk”.

2. Considering CMM, discuss the following points:
   - Is CMM a software development process?
   - If CMM is a process, what characterizes it as such? Similarly, If CMM is not a process, what is it, and why?
   - Can an organization that is CMM level 3 produce poor code? How about CMM level 5? Briefly justify your answer.
