Summary of Discussion

Gokhan Gokoz, 10-28-2002

First we argued about the security properties defined in the paper and decided that the authors did not elaborate on the implementation part. We talked about basic properties of CSP, BAN and Certification authority.

Dr. Cheng explained that because of the different nature of these three specification languages we could not make a real comparison between them.

We talked about the difference between conference and journal papers.
- Conference paper: new ideas, some specification
- Journal paper: persistency, more complete

We also discussed how to write a useful paper. From the limitations seen on the paper, the paper:
- Should be self-contained
- Should present different scenarios to solve
- Should be organized clearly and the author has to decide what to include and not to include

At the end we find out although the authors mentioned how the different formal methods will be used to identify vulnerabilities that they did not give a full understanding with detailed examples.
